Windows Category: Microsoft OfficeThe use of a prototype digital imaging system to assess the accuracy

of perioperative handoffs in the operating room. Hospital electronic information systems are used to manage patient flow in the operating room (OR). To improve accuracy, information systems that can

digitally record each step of patient care have been developed. We sought to evaluate a digital imaging system's ability to accurately record handoffs in the OR. We studied the accuracy of handoffs in the OR

using the same handoff template for all patients entering the OR in 2008. Handoffs were recorded in the OR using a digital imaging system that took photos of each step of the procedure. One hundred handoffs

were performed in the OR on patients having a variety of surgical procedures, involving a total of 18 different surgeons. Eighty-six percent of handoffs were accurately documented; 8% of handoffs were

missed. Approximately 10% of the patients experienced a handoff error, most commonly involving the wrong surgeon performing a procedure or a missed handoff. Although digital imaging is an effective tool

to document steps of a surgical procedure, ensuring accuracy in handoffs remains a challenge.Q: iphone - difference between [self release] vs [self setDelegate:nil]; I know what is meaning of [self release] and
